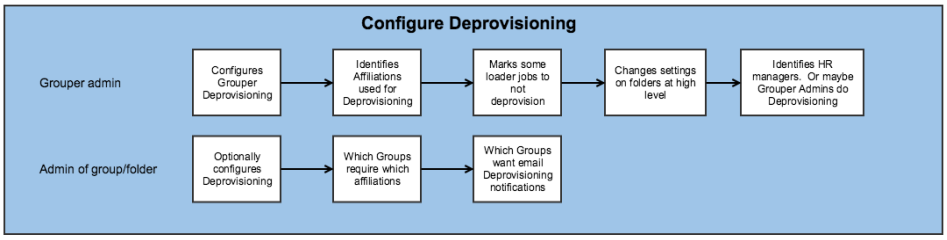
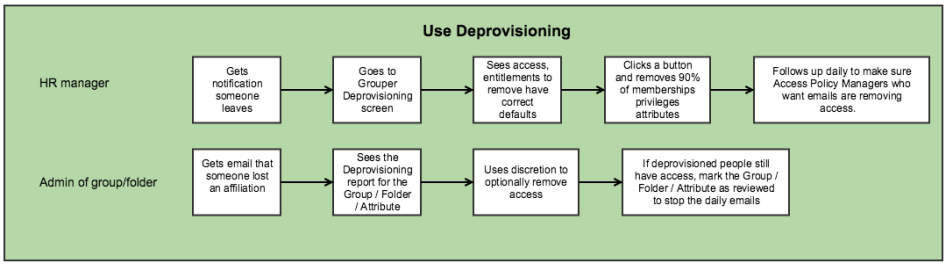
Grouper deprovisioning

Deprovisioning features in Grouper allow a deprovisioning administrator to see someone's access and instantly remove it.

Grouper will also help notify application administrators where Grouper is not the system of record or where manual deprovisioning is preferred.

Here are workflows around configuring and using deprovisioning.





Getting started

Deprovisioning settings on folders / groups / attributes

Deprovision someone

Deprovisioning report

Development notes

Grace periods, recent memberships
