

midPoint-Ethos-BEIS Functional Model

MidPoint and Grouper subscribe to Ethos. MidPoint will pull records to populate a minimal person schema and Grouper will pull records for creating reference groups.

BEIS pushes SPML messages, suitable for person schema. Unfortunately, BEIS would not handle a course roster.

Is Ethos ready for production use?

How long will BEIS be around?

BEIS is one way, from Banner out. Can Ethos receive data, NetID and email address from an entity registry and update Banner's third party ID and email address?

Ethos and BEIS only send new or modified records. No need to figure out deltas.
