# Periodic Batch Refresh

* A source (SoR or Registry) periodically produces full extract containing all relevant attribute values for all relevant entries. A consumer (Registry or target app) reloads its identity store/ cache entirely from the extract.

Periodic Batch Refresh

* Advantages

  * Easy

  * Predictable in time

  * Self-healing

  * Automatic impedance matching

* Disadvantages

  * Latency, Execution cost

  * What's an Audit?

  * Secondary transactional effects may be lost

  * Source state sensitivity

  * Unidirectional; JIC only
