

# Proposals for a container attribute for Entity Category values

- [URI under macedir.org](#)
- [IANA registry](#)

I've started to draft a "macedir.org-based" spec for this. It is based on the IETF Internet-Drafts format in anticipation of future work. This approach (to reuse the I-D format) is common in the "open" standards game. The source is all up on github: <https://github.com/leifj/macedir-entity-category>. Here is how to produce html and txt version:

Get the xml from github and install the tool:

```
# apt-get install git-core xml2rfc
# git clone git://github.com/leifj/macedir-entity-category.git
```

Build!

```
# cd macedir-entity-category
# make
# less macedir-entity-category.txt
```
