

Grouper messaging send receive example

Wiki Home	Download Grouper	Grouper Guides	Community Contributions	Developer Resources	Deployment Guide
---------------------------	----------------------------------	--------------------------------	---	-------------------------------------	----------------------------------

Configure a message sender (change log format) in grouper-loader.properties

```
#####
## Messaging integration with change log
#####
# note, change "messagingSample" in key to be the name of the consumer.  e.g. changeLog.consumer.
myAzureConsumer.class
changeLog.consumer.messagingSample.class = edu.internet2.middleware.grouper.changeLog.ChangeLogConsumerToMessage
changeLog.consumer.messagingSample.quartzCron =
changeLog.consumer.messagingSample.messagingSystemName = grouperBuiltinMessaging
changeLog.consumer.messagingSample.queueOrTopicName = sampleMessagingQueue
changeLog.consumer.messagingSample.messageQueueType = queue
```

As long as this is not edited in grouper-loader.properties, and the messagingSystemName is grouperBuiltinMessaging, the queue and privileges will be created:

```
#####
## Messaging overall settings for daemon jobs
#####
# auto create built in queues, topics, privileges
loader.messaging.settings.autocreate.objects = true
```

Make a messaging listener that will print out messages from that queue

```
#####
## Messaging listener using the messaging API
#####
# note, change "messagingListener" in key to be the name of the listener.  e.g. messaging.listener.
myAzureListener.class
# extends edu.internet2.middleware.grouper.messaging.MessagingListenerBase
# this listener will just print out messages: edu.internet2.middleware.grouper.messaging.MessagingListenerPrint
#

messaging.listener.messagingListenerSample.class = edu.internet2.middleware.grouper.messaging.
MessagingListenerPrint
messaging.listener.messagingListenerSample.quartzCron = 0 * * * * ?
messaging.listener.messagingListenerSample.messagingSystemName = grouperBuiltinMessaging
messaging.listener.messagingListenerSample.queueName = sampleMessagingQueue
```

Create events via GSH

```
GrouperSession grouperSession = GrouperSession.startRootSession();
Group group = new GroupSave(grouperSession).assignName("test:testGroup").assignCreateParentStemsIfNotExist
(true).save();
addMember("test:testGroup", "GrouperSystem");
delMember("test:testGroup", "GrouperSystem");
```

See the output

```
Change log entry: membership -> addMembership, null
