

Dictionary Vetter Plugin

The Dictionary Vetter Plugin performs [Registry Person Vetting](#) by comparing CO Person attributes against [Dictionary](#) values.

This plugin is experimental and may change across minor releases.

Configuration

The Dictionary Vetter is instantiated via a [Vetting Step](#). The plugin may be instantiated with different configurations for multiple Vetting Steps.

1. Prepare a new Standard Dictionary, as described [here](#). For information on the contents of the Dictionary, see *Vetting Records*, below.
2. Add a new Vetting Step, via *CO > Configuration > Vetting Steps >  Add Vetting Step*.
 - a. Select the Dictionary created above.
 - b. Determine which attributes are checked. See *Vetting Records*, below.

Vetting Records

The Dictionary Vetter examines the configured target attribute(s) and checks for matches in the specified Dictionary. A match results in a Failed vetting result. Note that matches are against Dictionary codes if set or values if not. Strings must match exactly.

Supported Attributes

- **Identity Documents:** The *Issuing Authority* of any Identity Document associated with the subject CO Person is checked against the Dictionary.
- **Organizations:** The *Country* of the first *Address* associated with any *Organization* attached to any CO Person Role of the subject is checked against the Dictionary. Note this requires that *CoPersonRole.o* be configured to use an [Attribute Enumeration](#) associated with an [Organization Dictionary](#).
