# Group Name Filter Plugin

The Group Name Filter Plugin replaces a CO Group Name with an Identifier, so that the name of the CO Group appears to be the Identifier.

## Configuration

1. This is a non-core plugin, see Installing and Enabling Registry Plugins for more information.
2. After instantiating the plugin as a Data Filter, proceed to the plugin's *Configuration* page.
3. Select the desired Identifier Type.

If more than one Identifier of the specified Type is found attached to the CO Group, it is not specified which value will be used.

## Supported Contexts

- ProvisioningTarget
