

GrouperShell (gsh) Gsh template execute (GshTemplateExec)

Wiki Home	Grouper Release Announcements	Grouper Guides	Grouper Deployment Guide	Community Contributions	Internal Developer Resources
---------------------------	---	--------------------------------	--	---	--

Use this class to execute a custom gsh template

Sample call

```
GshTemplateExec exec = new GshTemplateExec();
exec.assignConfigId("testGshTemplateConfig");
exec.assignCurrentUser(subject);
exec.assignGshTemplateOwnerType(GshTemplateOwnerType.stem);
exec.assignOwnerStemName(ownerStem.getName());
GshTemplateInput input = new GshTemplateInput();
input.assignName("gsh_input_myExtension");
input.assignValueString("zoomTest");
exec.addGshTemplateInput(input);
GshTemplateExecOutput output = exec.execute();
if (output.getGshTemplateOutput().isError()) {
    // handle this... e.g. from another template: gsh_builtin_gshTemplateOutput.addOutputLine
    ("Error running sub-template");
}
if (GrouperUtil.length(output.getGshTemplateOutput().getValidationLines()) > 0) {
    for (GshValidationLine gshValidationLine : output.getGshTemplateOutput().getValidationLines())
    {
        // handle this... e.g. from another template
        // gsh_builtin_gshTemplateOutput.addOutputLine((String)(gshValidationLine.getInputName() +
        ": " + gshValidationLine.getText()));
    }
}
```
