Data Scrubber Filter Plugin

The Data Scrubber Filter Plugin filters which attributes are passed from an Organizational Identity Source.

Configuration

1. This is a non-core plugin, see Installing and Enabling Registry Plugins for more information.
2. After instantiating the plugin as a Data Filter, proceed to the plugin's *Configuration* page.
3. From this page, click *Add Data Scrubber Filter Attributes.*

Attribute Processing

> ⚠ This Attribute Processing configuration is *experimental*, and may change across minor releases.

Data Scrubber Filter Attributes are processed by a simple elimination mechanism. Any Attribute matching a **Not Permitted** configuration is filtered. Conflicting configurations (or, currently, any configurations) using **Required** or **Optional** are ignored.

There are two types of attributes supported for filtration:

- Attributes directly attached to the Org Identity.
- Multi-valued attributes, such as Email Address and Telephone Number. Multi-valued attributes may be typed. If a type is specified, only values of that type are filtered. If no type is specified, all values for that attribute are filtered.

Supported Contexts

- Org Identity Source
