[Using Federation Manager to manage your SAML metadata](#) | [References](#)

The Incommon Federation and research and education (R&E) identity federations worldwide rely on the [Security Assertion Markup Language](#) (SAML) to perform federated authentication and access management.

The [SAML metadata standard](#) belongs to the family of SAML standards. A SAML metadata document describes a SAML deployment such as an Identity Provider or a Service Provider. Deployments share metadata via federation-operated metadata registries to establish a baseline of trust and interoperability.

In addition the main SAML metadata standard, InCommon and the global R&E federation community also rely on a number of metadata extensions such as [SAML V2.0 Metadata Extension for Entity Attributes](#) and [SAML V2.0 Metadata Extensions for Login and Discovery User Interface Version 1.0](#) (MDU I) to improve interoperability.

When interoperating with services registered in the Incommon Federation, you'll need to publish your Identity Provider (IdP) or Service Provider (SP) metadata using [Federation Manager](#).

A note to system administrators: This published metadata is what your fellow Incommon Federation participants rely on to locate and integrate with your IdP or SP. A copy of metadata that may reside on your server has no bearing on interoperation within the Incommon Federation.
