Changelog Provisioning Plugin

The Changelog Provisioning Plugin is a simple plugin that generates logfile entries on provisioning events. Entries are JSON encoded representations of CO Person and CO Group data.

> ⚠ The Changelog Provisioning Plugin is unrelated to Changelog Behavior.

Operations

Registry CO Person Transaction	Changelog Action
Add	Write full CO Person record to changelog
Edit	Write full CO Person record to changelog
Enter Grace Period	Write full CO Person record to changelog
Expiration / Becomes Inactive	Write CO Person record only (no Roles or Groups) to changelog
Unexpire / Becomes Active	Write full CO Person record to changelog
Delete	Write CO Person record to changelog (attributes will be empty)
Manual Provision	Write full CO Person record to changelog (subject to current CO Person and Person Role Status)

Registry CO Group Transaction	Changelog Action
Add	Write CO Group record (including memberships) to changelog
Edit	Write CO Group record (including memberships) to changelog
Delete	Write CO Group record to changelog (attributes will be empty)
Manual Provision	Write CO Group record (including memberships) to changelog

Configuration

⚠ Because this plugin allows configuration of arbitrary file paths to be written to (subject to the web server having permission to write to them), it is disabled by default. Care should be taken when enabling this plugin in a multi-tenant environment. You may also wish to set `open_basedir` in php.ini.

This is a non-core plugin, see Installing and Enabling Registry Plugins for more information.
