Upgrading Registry to v0.9

Registry v0.9 improves the generation of identifiers via Identifier Assignments. You must specify an acceptable character set for each existing Identifier Assignment configured. You can do this in one of two ways:

1. Bulk update all identifier assignments. In this example, all identifier assignments will accept only Alphanumeric characters:

```
SQL> update cm_co_identifier_assignments set permitted='AN';
```

2. Log in to Registry and select a permitted character set for each existing Identifier Assignment. You must click 'Save' even if you want to accept the default option presented.
