

Upgrading Registry to v0.9.3

- [members Group](#)

members Group

Registry v0.9.3 introduces a new `members` groups to automatically track membership of CO People in a CO and, optionally, COUs for the CO. A group named `members` will be automatically managed by CManage Registry for CO people. Likewise a `members` group will be automatically created and managed for each COU in the CO. The name of the COU members group will be `members:COU_name` and a member will be added to it when the CO Person has a CO Person Role attached to the COU. If the role is deleted for the user or the role is no longer attached to a COU then the CO Person will be automatically removed from the COU members group.

⚠ Before upgrading to version 0.9.3 you should verify that you do not currently have any CO Groups with the name `members` or with a name that begins with `members:`. If you do have groups in a CO with that name(s) you need to change the name before upgrading.

⚠ After upgrading you should force the creation of all the `members` groups for existing COs and COUs by browsing as the platform administrator to *Groups > All Groups* and clicking on *Reconcile All Members Groups*. You must do this once for each CO.
