Email Setup

COmanage Registry can use email to deliver invitations for enrollment and for notifications.

To configure email, copy `app/Config/email.php.default` to `local/Config/email.php` and edit as needed. (For versions prior to v1.0.0, simply edit `app/Config/email.php` in place.)

By default, mail is configured to use CakePHP's [MailTransport](#) class, which itself uses PHP's [mail\(\)](#) function.

You can also specify the mail From: address on a per-[Enrollment Flow](#) basis.

Support for further reconfiguration of mail delivery via the UI is planned. ([CO-390](#))
